

NWS Form E-5 U.S. DEPARTMENT OF COMMERCE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION NATIONAL WEATHER SERVICE MONTHLY REPORT OF HYDROLOGIC CONDITIONS	HYDROLOGIC SERVICE AREA: Pocatello, Idaho
	REPORT FOR: MONTH: December YEAR: 2015
TO: Hydrologic Operations Division, W/OH2 National Weather Service National Oceanic and Atmospheric Administration Silver Spring, Maryland 20910	SIGNATURE Corey Loveland Service Hydrologist
DATE: January 7, 2016	
When no flooding occurs, include miscellaneous river conditions, such as significant rises, record low stages, ice conditions, snow cover, droughts and hydrologic products issued (NWS Instruction 10-924).	

An X in this box indicates that no flooding has occurred for the month within this hydrologic service area.

Overview:

Last month brought some much cooler temperatures across the Hydrologic Service Area (HSA), especially during the latter part of December. In the earlier part of the month, record high temperatures were set in Pocatello, Idaho Falls, Burley and Stanley as well as record low temperatures at the beginning of the month. The month also brought some daily maximum precipitation records, but overall the month was near average for precipitation/snowfall. Well above normal precipitation primarily fell in the central mountains and west of us, as it seems we missed most of the overall storms. Overall, mostly one half to ten inches of precipitation fell across the HSA during the past month with most of the precipitation falling in Blaine, Fremont, Teton, Bonneville and Caribou counties. Temperature departures from normal for December show that across the HSA, we ranged mostly -1 to 1 degrees F below normal in the southern half of the HSA and it was a little bit warmer in the northern half which was about 1 to 3 degrees F above normal. Mean average temperatures ranged from 10 to 32 degrees F across the HSA. The Oakley COOP station had 5 days of average temperatures over 40 degrees F during December.

As far as the short-term 8 to 14 day Climate Prediction Center Outlook is concerned, the forecast is for near normal temperatures across southern and eastern Idaho. Eastern Idaho continues with the wetter than normal pattern with a 40 to 50 percent chance of above normal precipitation across most of the state. The one-month forecast graphics are found below. For the three-month outlook, the temperatures are forecast to be warmer than normal in eastern Idaho; mostly ranging from 33 to 40 percent chance of above normal temperatures within the HSA. As for precipitation, the outlook is for mostly a 33 to 40 percent of below normal precipitation bringing a forecast of drier conditions across southern and eastern Idaho.

Of the data available for the month, the stations within the HSA reaching the highest 24-hour temperature was the Raft River RAWs station reaching 62°F on the 9th. The station (non-SNOTEL and non-RAWs) with the lowest recorded temperature was the Stanley COOP station at -30°F on December 27th. The highest recorded 24-hr precipitation (non-SNOTEL) occurred at the St. Anthony COOP station where 1.50 inches fell on the 23rd. The highest recorded precipitation total (non-SNOTEL) occurred also at the Stanley Ranger Station WBAN where 4.96 total inches was recorded for the month. The Vienna Mine and White Elephant SNOTELs recorded 11.5 and 8.5 inches respectively of total precipitation for the month according to NRCS.

Reservoirs last month increased capacity overall by around 7% in the upper Snake River basin system (an increase of about 314 KAF occurred over the month and is currently sitting at 50% of capacity overall). Compared to last year at this time, it was about 67% of capacity. According to Natural Resources Conservation Service and U.S. Bureau of Reclamation reservoir data, the most notable increase in storage capacity is the Mackay and American Falls Reservoirs both increasing percent capacity by 14%. Mackay is currently at 107% of average and Island Park reservoir is currently at 90% of average. Magic Reservoir has the lowest relative storage; at 46% of average and Jackson Lake is the fullest at 131% of average.

Current streamflow conditions in eastern Idaho are mostly near to below normal for monthly streamflows for the majority of the unregulated streams (see graphic below).

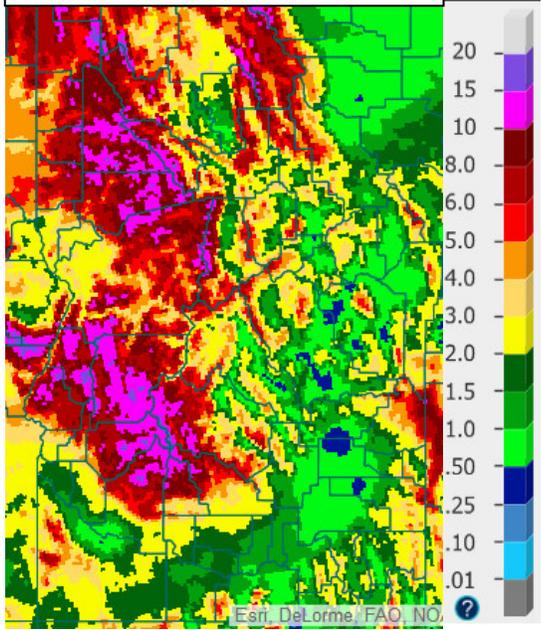

Drought conditions across eastern Idaho improved very slightly since last month's assessment. A portion of the Abnormally Dry area of the Snake River in Cassia county was removed. Currently, about 4 percent and 63 percent of the state is in Severe and Moderate drought respectively, with a recent removal of all Extreme Drought in the north. The latest U.S. Seasonal Drought Outlook shows a dramatic improvement in eastern Idaho with the forecast of persistent drought primarily in the central mountains and up into Montana including the Henrys Fork basin. The remainder of the HSA currently has no drought declarations.

The Idaho NRCS Snow Survey January 1st Idaho Surface Water Supply Index (SWSI) was not available this month.

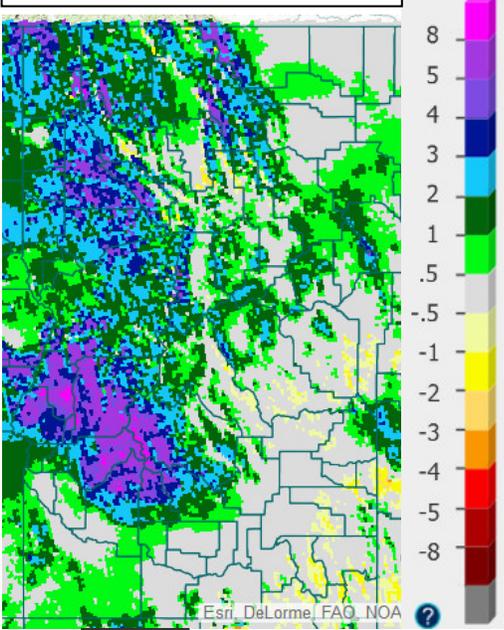

Please see the NWRFC (approximately daily computed ensembles), CBRFC, and NRCS Official January 1st beginning of water supply season streamflow volume forecasts and Bear Basin conditions below.

Westwide SNOTEL Water Year (Oct 1) to Date Precipitation % of Normal

Jan 05, 2016

Water Year (Oct 1)
to Date Precipitation
Basin-wide Percent
of 1981-2010 Average

* Data unavailable
at time of posting
or measurement
is not representative
at this time of year

Provisional data
subject to revision

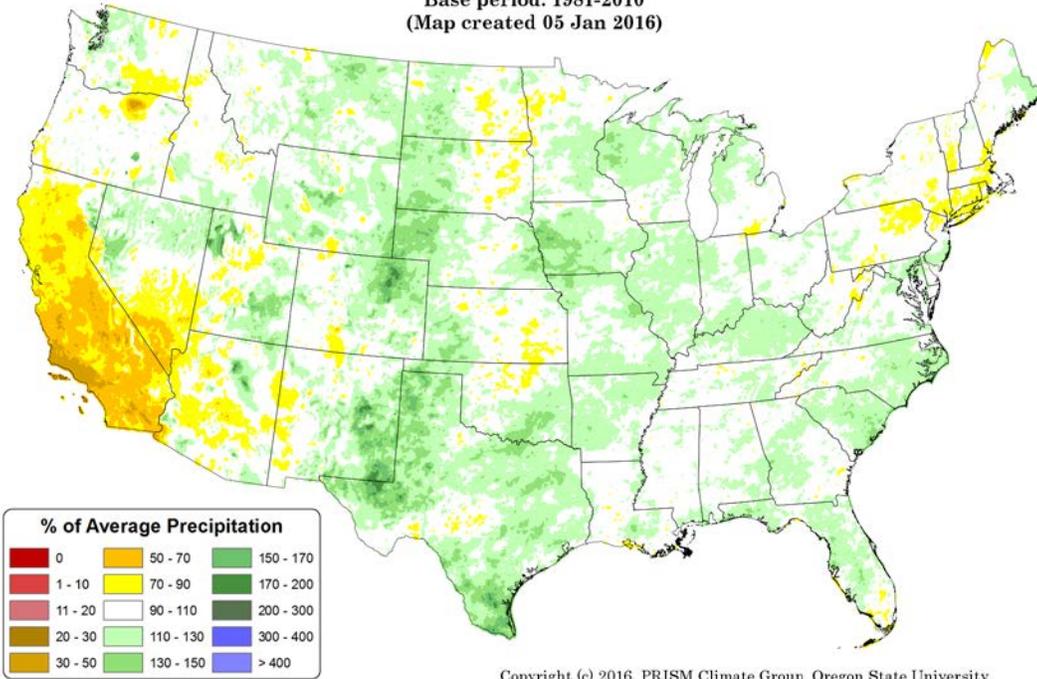

The water year to date precipitation percent of normal represents the accumulated precipitation found at selected SNOTEL sites in or near the basin compared to the average value for those sites on this day. Data based on the first reading of the day (typically 00:00).

Prepared by:
USDA/NRCS National Water and Climate Center
Portland, Oregon

**SNOTEL MTD % of Normal
Precipitation for end of December 2015**
(image is cropped from above image)

December brought much needed precipitation to the Pacific Northwest, which mostly seemed to miss eastern Idaho. Blaine county seemed to benefit the most with 150 to 200% of normal snow falling in the central mountains. Clark county near the Continental Divide received nearly 130 to 200% of normal as well as a small area near Malad in Oneida county. Cassia county, the mid to upper Snake and Caribou Highlands received less than normal precipitation with near normal amounts in the remaining areas/counties of eastern Idaho. Generally, December was good for WA, OR, ID, northern CA, NV and western MT receiving much needed well above average moisture. In eastern Idaho the benefitting counties for precipitation were: Clark, Fremont, Blaine, Lincoln and Oneida.

Percent of Normal Precipitation (%) 12/1/2015 – 12/31/2015

Idaho SNOTEL Current Snow Water Equivalent (SWE) % of Normal

The snow water equivalent percent of normal represents the current snow water equivalent found at selected SNOTEL sites in or near the basin compared to the average value for those sites on this day. Data based on the first reading of the day (typically 00:00).

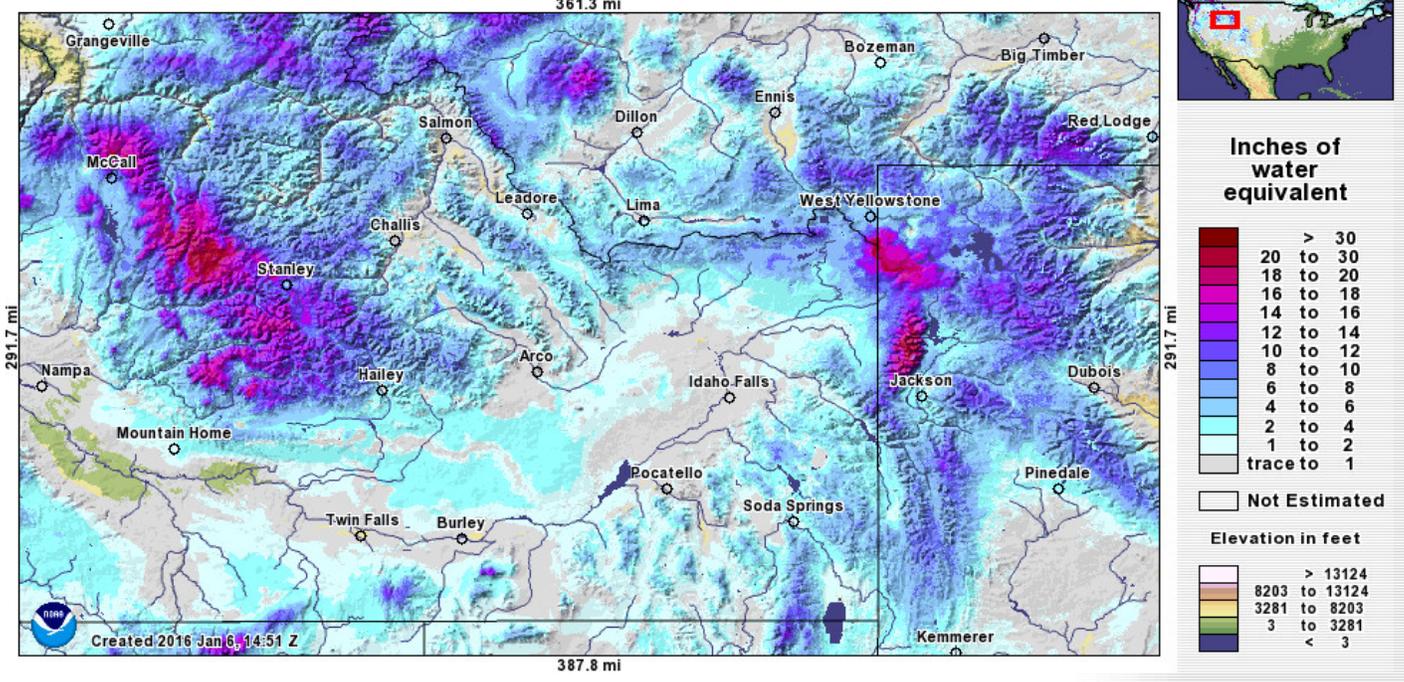

Prepared by:
 USDA/NRCS National Water and Climate Center
 Portland, Oregon
<http://www.wcc.nrcs.usda.gov>

Basinwide SWE compared to last month: mostly improvements across basins except for central mountains. Most notable gain was Goose and most notable loss was Little Lost basins compared to last month (see below):

U.S. Seasonal Drought Outlook

Drought Tendency During the Valid Period

Valid for December 17 - March 31, 2016
Released December 17, 2015

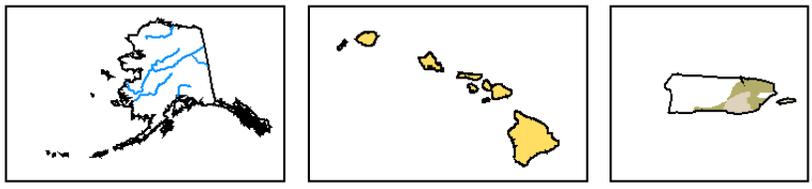

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).
